Annotation. The article discusses the issues of creating an organizational and economic model of the strategy for the development of ginners based on the study of their competencies.

Keywords: ginnery, competence, employee, development, model.

Аннотация. В статье рассматриваются вопросы создания организационно-экономической модели стратегии развития хлопкоочистителей на основе изучения их компетенций.

Ключевые слова: хлопкоочистительный завод, компетентность, сотрудник, развитие, модель.

Annotatsiya: Maqolada paxta tozalash korxonalarini ularning malakasini o'rganish asosida rivojlantirish strategiyasining tashkiliy-iqtisodiy modelini yaratish masalalari ko'rib chiqiladi.

Kalit so'zlar: paxta tozalash zavodi, malaka, xodim, ishlab chiqish, model.

Enter. The new role of man in the workplace and rapid changes in the economy, organizational culture and technology have created new problems such as careful selection, training, remuneration and their rational use of personnel. It is no longer possible to solve these tasks within the framework of traditional work with personnel. This work should be included as an equal component in the strategic management process. In modern conditions, management of human resources development should become an integral part of strategy planning and implementation process. Today, the strategic goals of the enterprise can be realized only by employees who meet the motivational requirements necessary to move to a certain strategy and a new, changing business environment. In this sense, strategic planning processes can develop successfully only if the consequences of the chosen strategy for employees are taken into account. For this, the company's strategy should be known to its employees, developed with the broad involvement of employees, because in this case, employees support management initiatives and ensure the implementation of the company's strategic goals.

In the Strategy of Actions on the five priority areas of development of the Republic of Uzbekistan in 2017-2021, the important tasks of "deepening structural changes, increasing its competitiveness at the expense of modernization and diversification of the leading sectors of the national economy" [1] are defined. The successful solution of such huge tasks requires the development of concrete measures to increase the competitiveness of the cotton ginning

enterprises of our republic by improving the management efficiency of the employees.

Analysis of literature on the topic.

Nowadays, many scientists are studying such categories as "labor potential", "labor quality", and solving the problems of developing labor potential and maximizing its use is one of the main tasks of the company's personnel policy [2,3,4].

Formation and development of labor potential are two fundamentally different mechanisms of labor potential management. Formation - giving the object certain basic characteristics; development is the process of changing an object to improve it. Development is usually understood as increasing the complexity of the system, improving its adaptability to external conditions, qualitatively improving the scale and quantitative growth of the economy and its structure, and social progress. Development means the emergence of new elements or the emergence of new objects and their differentiation. As the authors summarize the ideas, employee development is the process of training of their professional characteristics, self-development, professional activity and the formation of the personality of employees through the interaction of employees with each other [5].

The development of labor potential is the acquisition of new qualities and characteristics of labor potential that contribute to its alternative and efficiency in a dynamic internal and external environment. Development includes

important quantitative and qualitative changes, changes in labor potential. As a result of development, a new quality of labor potential is formed [6,7,8]. According to the definition of Yu.G. Odegov, management of labor potential is "a system of interrelated measures that provides a guiding, coordinating and stimulating effect of society on production participants and is directed to intensive factors of labor use" [9].

Analysis and results. Many industrial enterprises prefer to focus more investment on personnel development. This allows them to have highly qualified specialized staff, which in turn turns out to be more reliable and profitable than hiring specialists from outside. In addition, as a conscious approach to personnel policy, employee development has a positive effect on corporate standards and corporate ethics, which has a positive effect on the prestige and reputation of the enterprise. Usually, large industrial enterprises tend to follow a certain strategy of personnel development: it includes initial training of new employees (basic personnel training) and periodic measures to improve the professional level of existing personnel. Modern additional educational institutions create ample opportunities for planned activities for the development of employees.

In our opinion, the following sequence of actions is the most effective in developing a strategy for the development of employees of a cotton ginning enterprise:

- analysis of the socio-economic potential of the organization, identification of internal points for creating possible competitive advantages;
- product market analysis and determination of business areas;

- formation of the product-market, resource-market and integration strategy of the production enterprise;

- formation of financial and investment strategies;

- formation of social strategy;

- determination of potential and development of prospective requirements for employees of the cotton ginning enterprise, including divisions (corporate culture, socio-psychological climate, employee-organizational relations, etc.);

- formation of a strategy for the development of employees of the cotton ginning enterprise.

After completing the formation of the personnel development strategy, it is required to develop a personnel development management system that includes methodological, technical, informational and organizational support for the implementation of the developed personnel development strategy of the cotton ginning enterprise.

It is worth noting that a cotton ginning enterprise should formulate not only a full-scale strategy for the performance and development of its employees, but also all the listed high-level strategies, because they directly affect the development of personnel.

In order to ensure the effectiveness of the staff training strategy of the cotton ginning enterprise, it is appropriate to develop a rational organizational and economic model based on the effective use of existing human resources and aimed at increasing the competitiveness of the enterprise in the domestic and foreign markets.

From our side, the following organizational-economic model of the strategy for the development of employees of the cotton ginning enterprise is proposed (Fig. 1).

Link between business strategy and employee development strategy. The first block of the presented organizational-

economic model includes checking each element and direction in the business strategy and determining the requirements for personnel and the level of their participation in the implementation of the strategy.

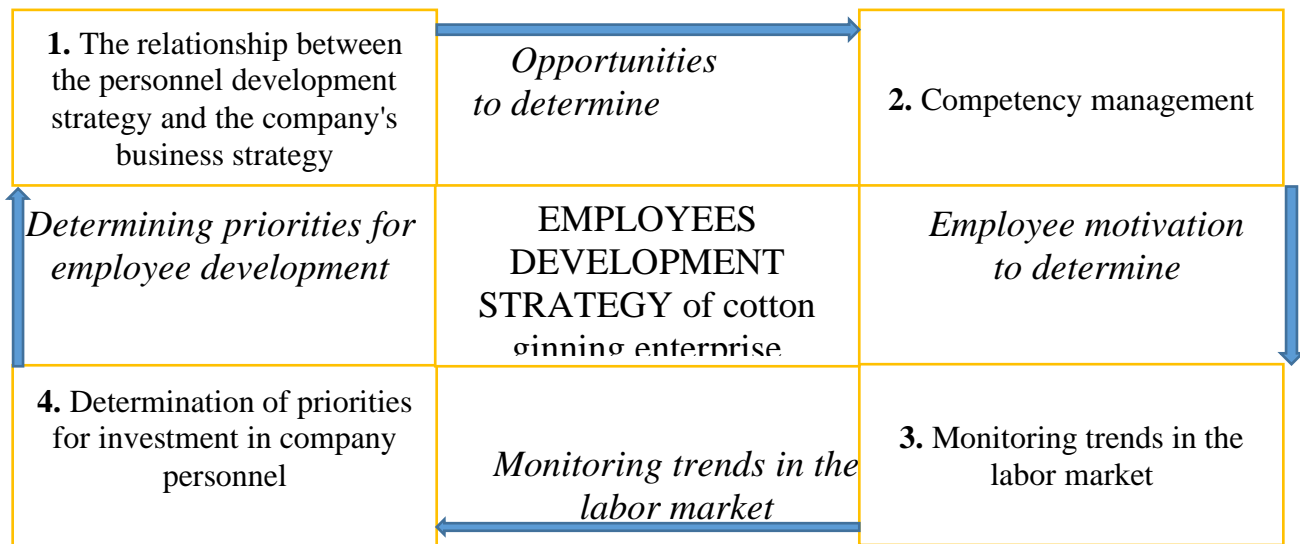

Figure 1. Organizational-economic model of the strategy for the development of employees of a cotton ginning enterprise (author's development)

Employee participation can be direct (moving a division or opening a branch in another city, moving some employees, recruiting employees in a new region and reducing some of the employees in the old place) or indirect (changing the brand of some products may not lead to significant employee participation in this process).

2. Management of employee potential. This step involves comparing the existing and required personnel capacity to implement the cotton gin's development strategy. In order for the industrial enterprise to understand the response to the changes in the labor market, they plan what kind of personnel (in terms of number, type, education, qualification, etc.) is needed to

implement the development strategy and increase competitiveness. At this stage, general trends in the company's personnel structure, including employee unemployment, the number of employees at retirement age, and similar indicators are studied. All of this information will be used to improve recruitment, training, staffing, and distribution of tasks across departments to create a balanced workforce in the future.

Analysis of the balanced potential of employees allows to determine the main types of employees necessary for the further development of the enterprise.

After that, it is determined which employee development programs should be expanded and, conversely, reduced.

3. Image of the enterprise as an employer.

Businesses that create a workforce development strategy must answer the question of their role in the eyes of employees and job seekers. In competitive conditions, the company's brand as an attractive employer is as important as the product brand. Creating a positive image of the company in front of competent employees is the most important long-term task of the HR director. Branding, PR and marketing methods can be used to make your company known as "the best place I want to work".

Corporate image, first of all, is a set of qualities and characteristics that often cannot be imagined as a visual image, because it is a very difficult process to determine it objectively.

Of course, the image of the enterprise is, first of all, a set of ideas about the type and field of activity of the enterprise, what and how the enterprise does its work, the quality of its goods and services, and their characteristics. Image is also related to the company's trademark and advertising symbols. It also includes the personal image of the owners and managers of the enterprise. However, the image of the enterprise is also the formation of some perception of the enterprise as a partner: market (relations with partners, customers, competitors, creditors) and social (employees, society, government, mass media) spheres. But the image in it is the reputation of the enterprise established in business relations and society, the impressions created by the employees of the enterprise, their behavior style, appearance.

Therefore, it should be noted that talking about the image of the enterprise means talking about the public opinion about the enterprise and its activities. The main problem of image is the matching of ideas about the enterprise and its social environment, that is, how the management and employees of the enterprise are imagined in the society and what the reputation of the enterprise is in reality. The management can make a lot of efforts and spend a lot of money to create the desired image of the enterprise.

Therefore, the most important thing, in our opinion, is to know those who need the image of the cotton ginning enterprise, what specific target groups of its social environment expect from the enterprise. All target groups want to see the cotton gin as a reliable and responsible social partner. The public mind has a strong habit of comparing various objects with certain human qualities. The image of a cotton ginning enterprise should have these qualities.

It should indicate the "friendliness", "care", "relevance", "impressiveness" of the cotton ginning enterprise. Creating a positive image of a cotton ginning enterprise is, first of all, an opportunity to convince the customer of the competitive advantages of its product or service and its potential employees, its reliability and prospects.

According to the researchers of this problem, the image of a cotton ginning enterprise should include the following four components:

- brand image - how high-quality and desirable goods it produces;

- management and financial image - is it managed effectively, is it worth becoming its shareholders;

- public image - is an active enterprise as a member of society;

- the image of the enterprise as an employer - does it pay well, how does it treat its employees.

In our opinion, it is necessary to emphasize the investment attractiveness and environmental aspect (as independent), because these factors are the most important lately.

Thus, the image of the enterprise is a reflection of the specific real and commercial characteristics of the enterprise in the minds of potential employees, both by the enterprise and by employees.

4. Priority of investments in employees.

In this section, the strategies for the development and competitiveness of the enterprise, the analysis of personnel potential and the construction of the image of the enterprise as an employer are mutually combined. Then the direction of investment in employees is chosen.

Conclusions and suggestions. Thus, the developed organizational and economic model will closely support the development strategy of the employees of cotton ginning enterprises and its successful implementation. As for the management of personnel development and training, managers know that personnel skills play an important role in increasing the competitiveness of a particular enterprise, but they do not pay serious attention to directing more funds to personnel training. However, training often does not lead to the expected results, which is due to the following mistakes in training employees. Training is considered to be one of the

elements that make up most of the costs of personnel services, but it helps to solve several strategic tasks at the same time. Because the skill level of employees always meets market requirements. In addition, the enterprise will have personnel reserves. Finally, training and further career development increase employee motivation and strengthen their loyalty. The only question is how to use the high-performance training budget. Here, too, many businesses face problems.

In order to increase the efficiency of the implementation of the employee development strategy in cotton ginning enterprises, it is necessary to pay attention to the following:

- an organizational and economic model of the strategy for the development of employees of a cotton ginning enterprise should be developed:

- a management system for the development of employees should be created in the management of the cotton ginning enterprise;

- it is necessary to systematically develop and update the strategy for the development of employees of the cotton ginning enterprise;

- the strategy for the development of employees of the cotton ginning enterprise should be developed and implemented in harmony with other strategy options;

- it is necessary to take into account the level of competence of employees, based on the nature of branch enterprises, when forming a strategy for the development of employees of a cotton ginning enterprise.
