**Annotation:** Cardiovascular disease (CVD) remains the leading cause of death globally, highlighting the urgent need for sustainable and accessible preventative and therapeutic approaches.

**Key words:** CVD, blood, cardiovascular, patient, further, research

**Izoh:** Yurak-qon tomir kasalliklari (KVH) global miqyosda o'limning asosiy sababi bo'lib qolmoqda, bu barqaror va foydalanish mumkin bo'lgan profilaktika va terapevtik yondashuvlarga shoshilinch ehtiyojni ta'kidlaydi.

**Kalit so'zlar:** KVH, qon, yurak-qon tomir, bemor, keyingi, tadqiqot

**Аннотация:** Сердечно-сосудистые заболевания (ССЗ) остаются ведущей причиной смертности во всем мире, что подчеркивает острую необходимость в устойчивых и доступных профилактических и терапевтических подходах.

**Ключевые слова:** ССЗ, кровь, сердечно-сосудистые заболевания, пациент, дальнейшие исследования.

**Introduction.** Traditional herbal medicine (THM) offers a promising avenue for promoting heart health, with a rich history of use in various cultures. This article explores the potential of THM to influence human cardiovascular physiology, unveiling its mechanisms and advocating for further research into this sustainable approach to heart health.

For centuries, various herbal remedies have been used to address cardiovascular concerns. Hawthorn (*Crataegus* spp.), for example, has been shown to improve heart function in patients with congestive heart failure[3]. Its potential mechanism involves enhancing myocardial contractility and coronary blood flow, possibly due to its flavonoid content[5]. Similarly, garlic (*Allium sativum*) has demonstrated cholesterol-lowering properties, potentially through inhibiting cholesterol synthesis and increasing its excretion[1].

The mechanisms by which THM exerts its effects on the cardiovascular system are diverse and still being elucidated. Some herbs, like garlic, may target specific physiological processes, while others like hawthorn might have a more holistic effect, influencing multiple pathways. Additionally, the complex interactions between various bioactive compounds within a single herb can contribute to its overall effectiveness [4].

Despite the promising initial research, further investigation is crucial to fully understand the mechanisms of THM and its impact on human cardiovascular physiology. Rigorous clinical trials are needed to evaluate the efficacy and safety of specific herbal formulations for various CVD conditions. Additionally, research into the potential interactions between THM and conventional medications is essential to ensure safe and effective integration into existing treatment regimens.

THM offers a potentially sustainable approach to heart health due to its natural origin, affordability, and widespread availability in many regions. Furthermore, THM often has a

lower environmental impact compared to the production of synthetic drugs. However, it is important to emphasize the importance of consulting with a qualified healthcare professional before using any herbal remedy to ensure its appropriateness and avoid potential interactions with other medications.

So, THM holds promise as a valuable tool for promoting cardiovascular health. By unveiling the mechanisms by which these traditional remedies influence human cardiovascular physiology, we can unlock their full potential for sustainable and accessible heart disease prevention and management. Further research is warranted to explore the effectiveness and safety of THM for CVD, paving the way for its responsible integration into a comprehensive approach to heart health.

Also, The superfamily of cytochrome p450 (CYP) takes part in the process of oxidation, peroxidation, and (or) reduction of vitamins, steroids, xenobiotics, and the majority of cardiovascular drugs in an oxygen- and NADPH-dependent manner. While during cardiovascular physiology and disease, the role of CYP is poorly understood. Evidence suggested that CYP plays an important role in the pathogenesis of cardiovascular diseases. The understanding was summarized as to the role that the receded CYP expression and (or) activity may play in the onset and progression of cardiovascular disease[2].

**Conclusion and recommendations.** THM presents a promising avenue for promoting cardiovascular health due to its potential effectiveness, affordability, and natural origins. Research is needed to develop standardized formulations of herbal remedies to ensure consistent quality and dosage. Well-designed clinical trials are crucial to definitively assess the efficacy and safety of specific THM for various CVD conditions. In-depth research is needed to fully elucidate the specific mechanisms by which various THM ingredients influence cardiovascular physiology. Studies exploring the safe and effective integration of THM with conventional cardiovascular medications are necessary.
