Annotation. Pedagogical communication methods used in the educational process are studied in detail in this article. Information is given about the role and importance of pedagogical dialogue in improving the quality of education, and it is written about the fact that improving the quality of education is one of the urgent issues of today, as well as about the reforms that are being carried out to improve the quality of education in our republic. The conditions for the organization of pedagogical communication and the factors affecting it are described. Pedagogical communication methods are divided into classifications, and educational methods used in the course of the lesson and their details are presented. A number of scientific research works have been studied, and the personal approaches of the author on the aspects that should be paid attention to by the teacher in the organization of pedagogical communication in the development of the educational process are given. In order to organize an effective lesson process, conclusions and proposals have been developed on which features of pedagogical communication should be paid attention to.

Keywords: communication, pedagogical communication, education, pedagogical process, teacher, student, development strategy, system, method.

INTRODUCTION

The development of the education sector in our republic, the training of personnel with competitive, advanced knowledge and potential in the future is one of the priority issues of today's Uzbek politics. Goals for improving the quality of education are also set in the Development Strategy of Uzbekistan. Including goal 44 "Increasing the quality of education in schools, bringing the knowledge and skills of pedagogues to the international level", goal 46 "Raising the level of coverage with higher education to 50% and improving the quality of education", goal 47 " "Targeted preparation of 10 potential higher education institutions to enter the QS and TNE international ratings by 2026" and set a number of goals to increase the quality of educational institutions and education, to bring our republic to the level of developed countries[2].

It should be noted that, based on the requirements of the state education standard, the historical commonality of national and religious values, their harmony with universal human values, more clearly illuminates the importance of these values in the current conditions of Uzbekistan, and students are correct in relation to science and technology development. ri approach and to educate a highly moral person for the society. This, in turn, serves to form a correct worldview in pupils and students who can draw correct scientific conclusions about the world and scientific and technical development, and can reasonably analyze the relationship between religion and secularism.

The role of pedagogical communication and methods in increasing the effectiveness of the educational process is incomparable. These

concepts are at the center of the educational process and are the main factors determining the quality of education.

Pedagogical communication is important as a method of organizing the educational process aimed at ensuring the intellectual, spiritual and physical development of students. Dialogues are selected taking into account the needs, interests and capabilities of students, which allows for individualization of the educational process.

Pedagogical methods include methods and techniques used in the implementation of the teaching process. They serve to deepen students' knowledge, develop their skills and abilities, and develop independent thinking skills. The correct selection and use of methods determines the effectiveness of the educational process.

LITERATURE ANALYSIS

Dialogue - is a greek word that means conversation, interpersonal conversation, and exchange of ideas, and occurs when two or more people speak. In the process of communication, a person lives and socializes under the influence of social experience, education, various relationships, moral norms, ideas and ideological factors and matures as a person. Interaction between people is considered one of the main categories of pedagogical and psychological sciences, and it includes the most important mechanisms of interpersonal relations.

Pedagogical communication - is a professional relationship between the teacher and students, which creates the

most favorable psychological environment and creates a positive mental climate in class and extracurricular activities.

The main goal of the teacher's close communication with students:

- to eliminate all processes that cause negative situations;
- forming students' independent thinking skills;
- to teach students to be active, to think freely, to express their opinions without fear and rely on them;
- development of hidden abilities of students;
- creating a mood of joy and happiness in class and extracurricular processes.

According to A.S. Makarenko, the teacher's communication should be in the form of a relationship based on respect and demand.

V.D. Sukhomlinsky states that "...every word spoken in the schoolyard should be carefully thought out, full of intelligence and reasoning, and aimed at a specific educational goal." According to the scientist, every word of the teacher should be directed not only to the ear of the student, but also to his heart. In the opinion of advanced teachers in general, education and upbringing are built only in the process of communication based on the position of mutual cooperation between the teacher and the student [3].

Pedagogical communication is a unique example of teacher's creativity in terms of its structure. Pedagogical scientists describe many descriptions of the teacher's communication with students in their scientific works, communication is first of all a personal psychological feature of the teacher. Scientists only give direction to the teacher for communication. In particular,

according to the Russian pedagogue V.A. Kan-Kalik, the structure of the teacher's pedagogical dialogue is carried out in the following directions [4]:

1. **Prognostic stage (modeling):** Modeling of future communication by the teacher with the class team.

2. **Communicative communication:** achieving the organization of direct communication during the initial mutual acquaintance with the student.

3. **Pedagogical process:** The teacher's behavior and pedagogical skills should be aimed directly at managing communication.

4. **Analysis of results:** Analysis of the implemented communication, objective assessment of achievements and shortcomings and modeling for future activities.

Establishing effective pedagogical communication is important for improving the quality of lessons, and it is one of the most urgent issues today. A number of scientists have been carrying out their scientific research in this regard. In particular, in the Republic of Uzbekistan, the problems of organizing effective pedagogical dialogue and increasing the effectiveness of lessons using modern technologies, the problem of professional training and competence of teachers were researched by N.A. Muslimov, Sh.E. Qurbanov, A.R. Khodzhaboyev. The structure and methods of pedagogical communication were studied by Kh. A. Faizullaevich, N. Ergasheva, R. Yolchiyev, and scientific publications were published.

Based on the above considerations and as a result of our own research, we can define pedagogical communication as follows:

Pedagogical communication - is a communicative process between the teacher and students during the educational process, which serves to achieve the goals of teaching and learning. This communication is important for engaging students in cognitive activities, arousing their interest, clarifying and clarifying questions, as well as for the implementation of educational and educational goals. The main features of pedagogical communication are as follows:

✓ ***Interactive feature:*** **Active, two-way communication between teacher and students.**

✓ ***Didactic orientation:*** **The purpose of communication is to teach and educate students.**

✓ ***Emotional and motivational effect:*** **Communication has a positive effect on the emotional state and motivation of students.**

✓ ***Individuality:*** **Taking into account the individual characteristics and needs of each student.**

These features play an important role in increasing the effectiveness of the educational process, building trust between students and teachers, and increasing students' interest in education.

METHODOLOGY

This study aims to analyze the importance of effective pedagogical communication in improving the quality of education and to study the methods and approaches used in this process. The research is carried out through the following methodological steps:

–Scientific articles, books, dissertations and previous studies on pedagogical communication are studied. At this stage, teaching methods, characteristics of pedagogical communication and factors affecting the quality of education are determined.

–Direct observations are made in groups. In the process of observation, the type, intensity and quality of communication between the teacher and students are evaluated.

–Data from observations are coded and analyzed using thematic analysis. Using this method, the main factors that ensure the effectiveness of pedagogical communication are determined.

–The results of the research are compared with previous scientific studies and the level of compatibility is determined. Based on the results, recommendations on effective organization of pedagogical communication are developed.

Application of this methodology makes it possible to draw general conclusions on improving the quality of education through the effective organization of pedagogical communication, as well as to develop practical recommendations for teachers and educational organizations.

ANALYSIS AND RESULTS

Effective pedagogical communication is of great importance in improving the quality of education and deepening the knowledge and skills of students. Pedagogical communication methods are different, and their correct

selection and application depends on the professional skills of teachers.

Pedagogical communication methods are mainly classified in two main directions:

- a) organizationally
- b) functionally.

Organizationally - the classification methods are related to how communication is organized, under what conditions and in what format. This includes:

Frontal (general) communication - in this type of communication, one teacher works with a large group, that is, with the whole class or audience. These include lectures, general discussions, and demonstration classes. This method is convenient for introducing students to a wider range of information.

- Lecture: A method of delivering large amounts of information given by the teacher. This method is effective when working with large groups.

- Lesson: A planned and structured learning process with students.

- Demonstrative lesson: A form of lesson that facilitates the acquisition of knowledge with the help of demonstrative materials.

Group communication - in this method, the teacher works with small groups. This form of communication provides more interactive participation of students. Examples of this are seminars and small group training.

- Workshop (Seminar): Students share their knowledge in small groups and discuss new knowledge.

- Discussion: Communication between students aimed at discussing problems and finding a solution together.

- Project Work: Students work together in groups on a project and present it.

Individual communication - in this approach, the teacher works with an individual student. This method takes the form of more tutoring, individual counseling and guidance.

- Tutoring: A method of imparting knowledge individually between one teacher and one student.

- Individual counseling: The teacher gives guidance and advice to the student individually.

- Mentoring: The teacher supports the student's personal and professional development by providing individual guidance.

Functionally, the classification methods depend on the content of communication and its pedagogical goals. These methods are divided into the following types:

Informative methods - these methods are aimed at providing students with new knowledge and information. Lectures, lessons, presentations are part of this method.

- Lecture: The delivery of a large amount of knowledge by the teacher.

- Presentation: conveying information using visual materials.

- Reading: Reading and mastering texts.

Motivational methods - these methods are aimed at making students interested in learning and instilling positive motivation in them. Asking questions, posing problems, and listening to students' opinions are examples of motivational communication.

- Question-Answer: Asking questions to activate students and arouse their interest.
- Creating problem situations: Involve students in solving problems.
- Experiments and practical Work: deepening of students' knowledge through independent work.

Cooperative methods - these methods are aimed at developing students' skills of mutual cooperation. It includes group work, project work, roller games.

- Group Work: Students work together in small groups.
- Role Plays: Students acquire knowledge by playing certain roles.
- Debate: Two-way debate between students.

Corrective methods - these methods are aimed at correcting students' ignorance and mistakes and improving their skills. Tests, control work, analysis and feedback are included in such methods.

- Tests: Various tests to determine the level of students' knowledge.
- Control work: Written or oral control work to assess students' knowledge and skills.
- Analysis and feedback: analyzing students' work and activities and giving them feedback.

In addition, the needs and level of students, the level of knowledge and interests of students, the purpose and topic of the lesson, as well as the capabilities, technical equipment and resources of the school or university are the main factors in choosing pedagogical communication methods. The length and time of the lesson is also an important factor. Some methods require more time, and some are effective in the short term.

A traditional lesson is an educational model designed for a certain period of time, the educational process is more focused on the personality of the teacher, it consists of the stages of introduction, clarification, consolidation and completion of the topic.

In the traditional teaching model, more methods such as lecture, question-and-answer, and practical exercises are used. For this reason, in these cases, the effectiveness of traditional lessons is much lower, and students become passive participants in the educational process. Usually, traditional teaching is considered as a passive teaching method. But whether students are active or passive in the lesson depends on how the lesson is conducted and how it is planned. In order to increase the efficiency of the traditional lesson and to increase the activity of students in the lesson, it is recommended to divide the new material into small pieces. Also, it would be appropriate to monitor how the students are mastering this material and to do various exercises and assignments for this purpose.

Non-traditional teaching technologies are aimed at increasing the activity of students, establishing cooperation and reciprocal communication between the pedagogue and students, and applying new modern teaching technologies to the educational process. Through non-traditional teaching, students are directed from forced obedience to conscious responsibility. In non-traditional education, students are able to find ways

to apply theoretical knowledge to practice, to discuss the learning material together, to take the initiative, to form, express and justify their personal opinions, to cooperate despite individual differences, to demonstrate their abilities, they learn to show each other's success, to support each other, to work productively in a small group formed to fulfill a common task.

Pedagogical communication methods are used to organize and develop communication

between teachers and students in the educational process. They include different methods and approaches. Based on our studies, we classified pedagogical communication methods used in the educational process into traditional and modern (Table 2) methods.

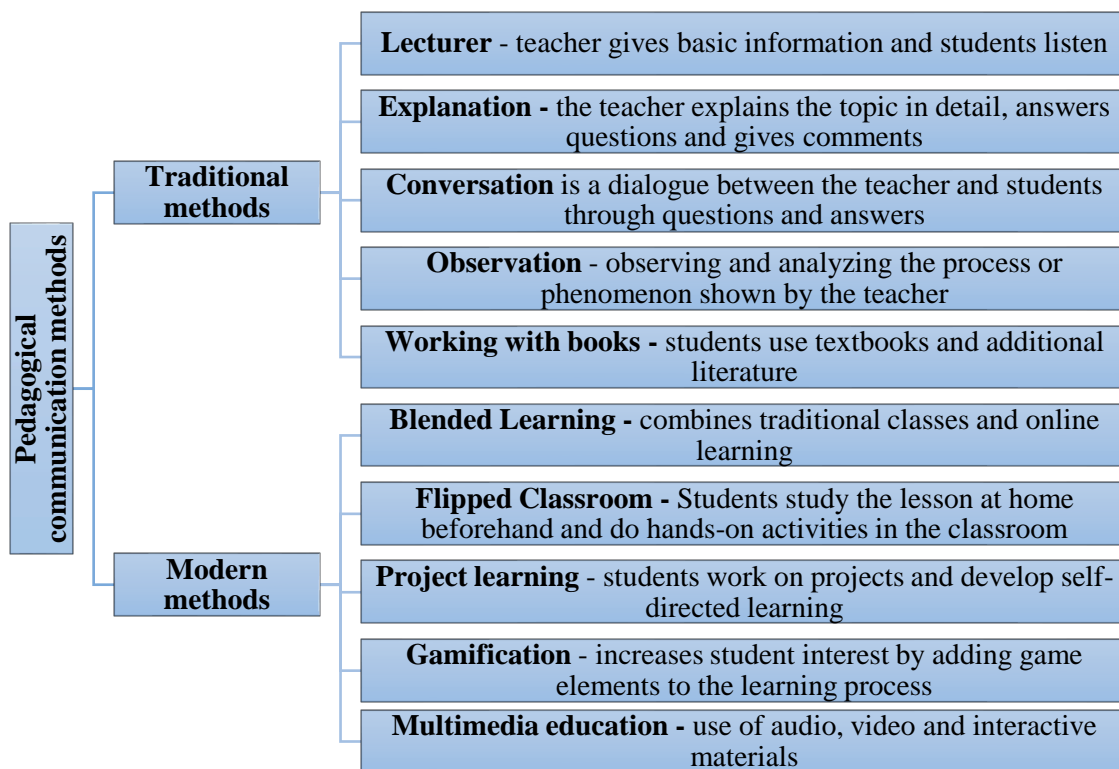

Table 2. Pedagogical communication methods¹

These methods and approaches enrich pedagogical communication and make the educational process more effective. Each method has its own characteristics and advantages, which are selected depending on the teaching objectives, the needs of the students and the content of the lesson. Pedagogical communication methods are different, and their correct selection and effective

use play a major role in the success of the educational process.

CONCLUSIONS AND SUGGESTIONS

Pedagogical communication methods are an integral part of the educational process, and their correct selection and effective use are of great importance in the development of students' knowledge and skills. Teachers can use different methods in

¹ Author development

their lessons to increase students' interests and make the educational process interactive and effective. Because each method has its own advantages and limitations, it is important to select methods that are appropriate for each lesson topic and students' needs.

From the results of this research, we have the following conclusions:

1. Pedagogical communication and pedagogical methods have a great role and importance in the educational process.

2. The use of effective pedagogical communication and methods in the educational process significantly improves the learning process of students, increases their interest and activity.

3. Pedagogical communication is at the center of the educational process and plays a key role in choosing educational methods that meet the needs and abilities of students.

4. Pedagogical methods are a set of methods and techniques necessary for the effective implementation of the educational process.

5. The use of innovative pedagogical approaches in the modern education process and their impact on the quality of education is positive.

6. Experimental results obtained by using various methods in the educational process were analyzed and their effectiveness was confirmed.

Also, in this work, the types of pedagogical communication and methods, their history, modern approaches and the experience of their use in practice were widely covered. With the emergence of new technologies and innovative approaches in the current educational process, the demand for pedagogical communication and methods and their changes were also analyzed. Below, we have developed proposals on the aspects that should be paid attention to in the organization of pedagogical dialogue in the course of educational institutions.

Individual characteristics and needs of students should be taken into account when

choosing pedagogical communication and methods.

1. It is necessary to actively use modern pedagogical technologies and approaches, to constantly improve them.

2. It is necessary to organize regular seminars and trainings for improving the qualifications of teachers;

3. It is necessary to create the necessary conditions for the introduction of innovative pedagogical methods in the educational process.

4. It is necessary to continue research on the study of new types of pedagogical communication and methods and their implementation.

5. It is necessary to develop new approaches and methods to increase the effectiveness of methods in the educational process.

6. According to the results of the research, the correct selection and use of pedagogical communication and methods is important in increasing the effectiveness of the educational process.

7. As a result of the in-depth study of the scientific and practical aspects of pedagogical communication and methods and their widespread use in educational institutions, the quality of education and the level of knowledge of students will increase.

Thus, in this research work, it contributes to the improvement of the educational process by creating a scientific-practical basis for pedagogical communication and methods.
