Abstract: Effective assessment of medical students in pediatrics requires combining traditional and innovative methods to address diverse competencies. This review examines key approaches, including the Minnesota Method, OSCEs, multimedia tools, and advancements like virtual simulations and AI. It highlights the importance of programmatic assessment and simulation-based education while addressing challenges such as resource limitations and educator training. Recommendations focus on enhancing infrastructure, faculty development, and collaborative efforts to better prepare students for clinical practice.

Keywords: pediatric education, assessment, OSCE, artificial intelligence, training.

Annotatsiya: Pediatriya yo‘nalishidagi tibbiyot talabalari bilimini samarali baholash uchun turli xil kompetensiyalarni qamrab olish maqsadida an’anaviy va innovatsion usullarni uyg‘unlashtirish zarur. Ushbu sharh Minnesota usuli, OSCE (Ob’ektiv strukturlashtirilgan klinik imtihon), multimedia vositalari hamda virtual simulyatsiyalar va sun’iy intellekt kabi ilg‘or yondashuvlarni tahlil qiladi. U dasturiy baholash va simulyatsiyaga asoslangan ta’limning muhimligini ta’kidlaydi, shu bilan birga resurs cheklanganligi va o‘qituvchilarni tayyorlash kabi muammolarni hal etishga e’tibor qaratadi. Tavsiyalar

talabalarni klinik amaliyotga yaxshiroq tayyorlash maqsadida infratuzilmani takomillashtirish, professor-o'qituvchilar salohiyatini oshirish va hamkorlikdagi sa'y-harakatlarni kuchaytirish masalalariga qaratilgan.

Kalit so'zlar: pediatriya ta'limi, baholash, OSCE, sun'iy intellekt, tayyorgarlik.

Аннотация: Эффективное оценивание студентов-медиков в области педиатрии требует сочетания традиционных и инновационных методов для оценки различных компетенций. В данном обзоре рассматриваются ключевые подходы, включая Миннесотский метод, объективные структурированные клинические экзамены (ОСКЭ), мультимедийные инструменты, а также такие передовые технологии, как виртуальные симуляции и искусственный интеллект. Подчеркивается важность программного оценивания и симуляционного обучения при решении таких проблем, как ограниченность ресурсов и подготовка преподавателей. Рекомендации сосредоточены на совершенствовании инфраструктуры, развитии преподавательского состава и совместных усилиях по улучшению подготовки студентов к клинической практике.

Ключевые слова: педиатрическое образование, оценивание, ОСКЭ, искусственный интеллект, обучение.

Language: English

INTRODUCTION.

Assessing medical students' understanding of pediatric subjects effectively requires a multifaceted approach that incorporates various assessment methods to capture different competencies. The Minnesota Method, as implemented in the Education in Pediatrics Across the Continuum (EPAC) program, emphasizes a learner-driven, competency-based assessment model using Core Entrustable Professional Activities (EPAs). This approach involves frequent

workplace-based assessments and summative evaluations, which are reviewed by a clinical competency committee to determine students' readiness for advanced clinical rotations[1]. The Objective Structured Clinical Examination (OSCE) is another widely used method, providing a structured and objective evaluation of clinical skills. Studies have shown that OSCEs can effectively assess pediatric medical students' clinical abilities, with higher scores in physical examination and skills assessments

compared to case assessments[2,3]. Additionally, multiple-choice questions (MCQs) are commonly used, with research suggesting that longer items, relevant vignettes, and clinically-relevant content enhance the quality of these assessments[4]. Multimedia tools, such as video-based teaching and virtual reality curricula, have also been developed to assess understanding in specific areas like pediatric cardiology, demonstrating high content validity and improved student performance[5,6]. Formative assessments, including self-assessment and feedback, play a crucial role in identifying areas of concern, such as documentation skills in pediatric history taking, and enhancing students' confidence and learning outcomes[7–9]. Overall, a combination of these methods, tailored to the specific educational objectives and competencies required in pediatrics, provides a comprehensive and effective assessment strategy for medical students.

METHODS

This review is based on a comprehensive search of peer-reviewed articles, educational guidelines, and expert opinions. Databases such as PubMed, Google Scholar, and Web of Science were searched using terms like "pediatric education," "medical student assessment," "teaching strategies," and "curriculum development." The search included publications from the past decade to ensure the inclusion of recent advancements. Studies were selected based on relevance,

quality, and their contribution to understanding effective assessment and teaching practices. Additionally, reviews focusing on innovative technologies and their application in medical education were prioritized. Relevant diagrams and tables from existing literature were analyzed for their utility in enhancing understanding and engagement in pediatric education.

Assessment methods: The optimal balance between written and practical assessments in evaluating medical students' knowledge and skills involves integrating both methods to comprehensively assess cognitive and practical competencies. The Objective Structured Practical Examination (OSPE) has emerged as a superior tool for practical assessments, offering objectivity, consistency, and reliability compared to traditional methods. Studies have shown that students perform better and prefer OSPE due to its structured and performance-based nature, which enhances learning and skill acquisition[10–12]. OSPE's ability to provide detailed feedback and cover a wide range of skills, including communication and clinical decision-making, makes it a valuable component of medical education[13,14]. However, written assessments, such as multiple-choice questions, remain essential for evaluating theoretical knowledge and ensuring a comprehensive understanding of medical concepts[15,16]. The integration of programmatic assessment, which combines various assessment tools,

supports continuous learning and development by providing meaningful feedback and fostering self-directed learning[17,18]. This approach aligns with competency-based education models, emphasizing the development of both specific and transversal competencies necessary for effective medical practice[15,18]. Therefore, an optimal assessment strategy in medical education should incorporate both written and practical assessments, utilizing tools like OSPE for practical skills and adaptive assessments for theoretical knowledge, to ensure a holistic evaluation of students' competencies[16,19]. This balanced approach not only prepares students for their future roles in healthcare but also supports lifelong learning and professional development.

Significance of innovations and technology. Innovations such as virtual simulations, artificial intelligence (AI)-driven assessments, and digital tools have significantly transformed pediatric education, offering new avenues for enhancing medical training. Virtual reality (VR) simulations have been particularly impactful in pediatric emergency training, providing high-fidelity experiences that improve clinical reasoning and procedural skills. For instance, a study demonstrated that VR simulations led to a significant increase in medical students' knowledge, with scores rising from 7.80 to 10.90 out of 12 points after participating in a VR scenario involving a newborn with late-

onset sepsis[20]. Similarly, VR technology is being used in pediatric hospitals for preoperative planning, education, and pain management, contributing to improved patient experiences and educational outcomes[21]. AI is also playing a crucial role in pediatric education by facilitating curriculum design, creating individualized study plans, and enhancing diagnostic accuracy. AI tools have been integrated into medical education to assist in developing new teaching strategies and providing real-time feedback, thereby improving learning outcomes and clinical skills[22,23]. Large language models (LLMs), a subset of AI, are being utilized to enhance curriculum design and provide real-time feedback, although they come with challenges such as potential biases and ethical concerns[24]. The readiness of educators and residents to incorporate AI into pediatric education is evident, with a majority expressing willingness to integrate these technologies into their teaching tools[25]. Furthermore, AI and machine learning are being used to develop predictive models for various pediatric conditions, such as bronchiolitis and neonatal sepsis, highlighting the potential of AI to revolutionize pediatric healthcare and education[26]. Simulation-based education (SBE) has also been recognized as an effective method for improving the proficiency and competence of medical professionals in pediatric settings, providing immersive environments for active learning[27]. Overall, the integration

of VR, AI, and other digital tools in pediatric education is fostering a more interactive, efficient, and effective learning experience, preparing future healthcare professionals to meet the demands of modern medical practice[28].

CHALLENGES AND RECOMMENDATIONS

Pediatric education faces several challenges, including limited simulation resources and variability in teaching quality. These issues are compounded by factors such as a shortage of trained educators familiar with simulation-based education, lack of infrastructure, and insufficient clinical exposure for trainees[29–31]. Simulation-based medical education (SBME) is recognized as a valuable tool for overcoming these barriers by providing a controlled environment for practicing procedural skills and managing emergencies, yet its implementation is often hindered by logistical constraints and resource limitations[29,30,32]. To address these challenges, investing in technology and infrastructure is crucial. High-fidelity simulators and web-based platforms can enhance the accessibility and quality of simulation training, especially in resource-constrained settings[30,33]. Training educators is another critical recommendation, as it ensures that facilitators are well-equipped to deliver effective simulation-based education. Programs like PediSTARS in India emphasize the importance of faculty development to foster a culture of

simulation in healthcare education[31,31]. Additionally, incorporating student feedback into the curriculum can help tailor educational programs to better meet the needs of learners, thereby improving engagement and learning outcomes[33]. By addressing these areas, pediatric education can be significantly enhanced, leading to improved competency in clinical practice and better patient care outcomes[34,35]. Collaboration among institutions to share resources and best practices can further support these efforts, ensuring that simulation-based education is effectively integrated into pediatric training programs[32]. Pediatric education has evolved significantly, with a growing emphasis on competency-based models and individualized learning experiences. The Minnesota Method exemplifies the shift toward frequent workplace-based assessments and comprehensive summative evaluations, providing a more holistic understanding of student readiness. However, its reliance on well-trained faculty and consistent clinical exposures underscores the need for adequate educator preparation and institutional support.

OSCEs and Objective Structured Practical Examinations (OSPEs) remain cornerstones in evaluating clinical and practical skills, offering reliability and objectivity. Their structured nature allows for detailed feedback and targeted skill enhancement. Nonetheless, logistical challenges, including time and resource requirements, must be addressed to ensure

their widespread implementation. Innovations like virtual reality (VR) and artificial intelligence (AI) have introduced transformative possibilities in pediatric training[36,37]. VR simulations improve clinical reasoning and procedural skills by immersing learners in realistic scenarios, while AI-powered tools assist in personalized study plans, curriculum design, and diagnostic training. However, the ethical considerations, potential biases, and high costs associated with these technologies present challenges to their integration, especially in resource-limited settings[38-39]. Simulation-based education bridges the gap between theory and practice by offering a safe and controlled environment for learning. However, ensuring the accessibility of high-fidelity simulators and adequately training faculty are critical for its success. Programs that focus on faculty development and inter-institutional collaboration, such as PediSTARS,

provide effective frameworks for overcoming these barriers[40-43].

Conclusion. The integration of diverse assessment methods and emerging technologies in pediatric education provides a robust framework for evaluating medical students' knowledge and skills. Methods like OSPE, OSCE, and programmatic assessments, coupled with tools like VR simulations and AI-driven platforms, ensure a comprehensive approach to competency development. However, challenges such as resource constraints and variability in teaching quality highlight the need for investment in infrastructure, educator training, and collaborative efforts among institutions. By addressing these challenges, pediatric education can be significantly enhanced, equipping students with the skills and knowledge required for modern medical practice and improving patient care outcomes.
