Abstract: The digital transformation of early childhood education has significantly impacted the learning process, offering both opportunities and challenges. The integration of digital technologies enhances learning experiences, increases access to resources, and prepares young children for a digital future. This article explores the benefits and challenges of digital technologies in preschool education, including the potential role of artificial intelligence, virtual reality, and data-driven learning.

Keywords: digital transformation, early childhood education, artificial intelligence, virtual reality, screen time, inclusive education, digital divide.

Introduction: Digital transformation in education is not just about implementing new technologies into the learning process but also about a deep reform in the approaches to teaching and nurturing children. In early childhood education, which serves as the foundation for skill development, the integration of technology plays a particularly important role. The application of digital tools opens new horizons for children's development, helps create a more accessible and diverse educational environment, but it also presents certain risks.

The importance of digitalization in early childhood education is increasing in light of the rapid development of technology. According to UNESCO (2020), the use of technologies in early childhood learning can stimulate cognitive development and foster critical thinking. However, it is important that technologies are used in a balanced way, considering the age-related characteristics and pedagogical approaches.

The aim of this paper is to analyze the impact of digital technologies on early childhood education, highlight the main advantages and challenges, and present predictions for the future development of technologies in this field. Digital technologies offer a wide range of tools for educating children. For example, tablets and interactive whiteboards allow educators to create engaging and educational tasks that motivate children to learn. The use of educational apps helps children develop cognitive and language skills. Research conducted in the United Kingdom in 2019 showed that the use of interactive whiteboards in preschools increased children's engagement and improved their problem-solving abilities.

In 2020, the educational platform for preschool children, "Khan Academy Kids," attracted over 20 million users worldwide, confirming the high interest in digital educational resources among parents. Virtual reality (VR) and augmented reality (AR) are also beginning to be used in early childhood education. For example, kindergartens are using VR headsets to conduct virtual field trips, allowing children to "visit" museums, historical sites, and even other countries without leaving the classroom. This is especially important for children living in rural and remote areas, where access to cultural institutions is limited.

Digital technologies not only serve as tools for learning but also actively contribute to the development of social skills. The use of online games and collaborative projects helps children learn to work in teams, solve common tasks, and build communication with other children.

According to a study conducted in the United States in 2021, children who participated in collaborative online projects showed a higher level of social activity and communication skills compared to those who learned without using digital tools.

The digital divide remains one of the key challenges that educational institutions face. Not all children have equal access to modern technologies, which may lead to educational inequality.

According to a study by the World Bank (2021), more than 40% of children in low- and middle-income countries do not have access to digital devices, which limits their opportunities for full-fledged learning in Russia, according to Rosstat data (2020), 25% of families with preschool-age children do not have permanent access to the internet, creating significant barriers to the use of online education and educational apps.

Addressing this problem requires ensuring equal access to digital resources for all segments of the population. This includes both government initiatives to subsidize devices and public initiatives aimed at providing free internet and training. Excessive screen time can have negative effects on children's health. The World Health Organization (WHO) studies emphasize that prolonged use of technology can lead to vision problems, sleep disorders, and a decrease in physical activity.

According to a study published in the *JAMA Pediatrics* journal in 2020, children who spent more than 2 hours a day on screens showed lower results in attention and memory tests. WHO recommends limiting screen time for children under 5 years old to one hour per day. This highlights the importance of a balanced approach to the implementation of digital technologies in early childhood education, where digital devices should be used in moderation and always combined with physical activity. For the effective use of digital technologies in early childhood education, educators must be properly trained. This includes not only technical skills in using devices but also knowledge of methods for using technology to foster children's development. A 2022 study in Germany found that 60% of preschool educators reported a lack of knowledge and skills to effectively use digital technologies in teaching. In Russia, the Ministry of Education and Science launched a professional development program for educators in the field of digital technologies in 2021, but only 15% of educators completed the necessary training.

In the future, artificial intelligence (AI) is expected to become an integral part of early childhood education. AI can analyze children's behavior and select individualized tasks based on their developmental level and preferences.

The application of AI in education helps tailor materials to each child, as evidenced by successful AI-based platforms in educational institutions in Finland and Singapore.

Virtual reality (VR) and augmented reality (AR) offer new ways to engage children in the learning process. These technologies allow educators to create interactive learning environments in which children can "immerse" themselves in the material, exploring nature, history, and other subjects through visual and auditory stimuli. In the coming years, the use of VR and AR in early childhood education is expected to increase, allowing children to develop spatial imagination and enhance their interest in academic subjects.

Conclusion: Digital transformation in early childhood education provides unique opportunities for children's development, improving the quality of education and creating an inclusive learning environment. However, the implementation of technology must be balanced, taking into account not only the benefits but also the challenges, such as the digital divide and the impact of screen time on children's health. For successful use of technologies, it is necessary not only to improve infrastructure and access to devices but also to train educators and create safe and healthy conditions for children. In the future, with the development of artificial intelligence, virtual reality, and other technologies, the opportunities for teaching and developing children will only expand.
